Prompt Injection / Jailbreak Detection — Fine-tuning Comparison

Fine-tunes three transformer encoder models on a combined prompt-injection dataset:

1. **BERT-base** (`google-bert/bert-base-uncased`)
2. **DeBERTa-v3-base** (`microsoft/deberta-v3-base`)
3. **ModernBERT-base** (`answerdotai/ModernBERT-base`)

Run cells in order. Estimated training time: **~1-2 hours total** on T4 with fp16.

Setup: Runtime → Change runtime type → **T4 GPU** (or A100 if you have Pro).

Step 1: Verify GPU is attached

```
!nvidia-smi
```

```

+-----------------------------------------------------------------------------------------+
```

Step 2: Mount Google Drive

Optional but **strongly recommended** for long runs — Colab sessions can disconnect, and Drive lets you keep checkpoints, models, and results across reconnects.

```
try:
    from google.colab import drive
    drive.mount('/content/drive')
    print('Drive mounted')
except ImportError:
    print('Not running in Colab — Drive mount skipped')
```

```
Mounted at /content/drive
Drive mounted
```

Step 3: Install dependencies

Colab has `torch`, `pandas`, `numpy`, `matplotlib`, `seaborn` preinstalled. We add the HuggingFace stack and `sentencepiece` + `protobuf` (required by DeBERTa-v3's tokenizer).

```
!pip install -q -U transformers datasets accelerate scikit-learn sentencepiece protobuf
```

```

Step 4: Imports, seeds, device, paths

```
import os
import math
import random
import time
from pathlib import Path

import numpy as np
import pandas as pd
import torch
import matplotlib.pyplot as plt
import seaborn as sns

from datasets import Dataset, load_dataset
from sklearn.metrics import (
    accuracy_score,
    confusion_matrix,
    f1_score,
    precision_score,
    recall_score,
    roc_auc_score,
    roc_curve,
)
from sklearn.model_selection import GroupShuffleSplit, train_test_split
from transformers import (
    AutoModelForSequenceClassification,
    AutoTokenizer,
    EarlyStoppingCallback,
    Trainer,
    TrainingArguments,
)

# Reproducibility
SEED = 42
random.seed(SEED)
np.random.seed(SEED)
torch.manual_seed(SEED)
if torch.cuda.is_available():
    torch.cuda.manual_seed_all(SEED)

# Device check
device = 'cuda' if torch.cuda.is_available() else 'cpu'
print(f'device: {device}')
if device == 'cuda':
    print(f'GPU: {torch.cuda.get_device_name(0)}')
    print(f'Memory: {torch.cuda.get_device_properties(0).total_memory / 1e9:.1f} GB')
